REASONING MAP

Question. Should an ESG investor count IKEA's forest projects in Brazil as risk reduction, when its main Brazilian supplier has been fined for environmental offences?

IKEA's Brazilian footprint and the Mercosur bloc

1 Nova Prata (RS): supplier Artemobili
Fined in 2018 and 2022 for environmental offences. IKEA = 66% of the supplier's Brazilian orders in 2023 [1]

2 Tapajós basin (PA) and Atlantic Forest hub (ES)
WWF projects with IKEA; partnership renewed to 2030 [3]

3 Paraná and Santa Catarina
BTG Pactual project: about 4,000 ha, announced 6 Nov 2025 [4]

4 Mercosur: Argentina, Brazil, Paraguay, Uruguay
EU–Mercosur interim deal applied since 1 May 2026 [6]. Any link to forest loss is my inference, not tested.

2018 — Supplier fined
2022 — Second fine
27 Feb 2024 — Disclose / ARTE investigation [1]
12 Mar 2024 — IKEA: supplier not supplying now [2]
24 Sep 2025 — WWF partnership renewed to 2030 [3]
6 Nov 2025 — BTG Pactual, 4,000 ha [4]
1 May 2026 — EU–Mercosur interim deal applied [6]
30 Dec 2026 — EUDR applies to wood furniture (large firms) [5]

1 · Projects are elsewhere

The forest projects sit in the Tapajós basin and the Atlantic Forest. The supplier sits in Rio Grande do Sul. No public source links the two.

[1][3][4]; my inference on the link

2 · Risk sits at the supplier

IKEA says the supplier breached its code and no longer supplies it [2]. The EUDR tests supplier-level traceability for wood furniture from 30 Dec 2026 [5].

[2][5]

3 · What to price

Supplier-level traceability and deforestation PAI data, not project headlines. Under SFDR, a project claim alone does not show lower risk.

PAI and controversy framework of the course (my reading)

My thesis (draft). No, not on current evidence. Forest projects elsewhere do not offset supplier risk. The risk must be priced where the wood is harvested and processed.

SUMMARY

IKEA funds forest work in Brazil: WWF projects in the Tapajós basin and the Atlantic Forest [3], and a 4,000-hectare BTG Pactual project in Paraná and Santa Catarina [4]. Its main Brazilian supplier, Artemobili (Nova Prata, RS), was fined in 2018 and 2022, and IKEA accounted for 66% of its Brazilian orders in 2023 [1]. In March 2024, IKEA said the incidents breached its supplier code and that the supplier no longer supplied it [2].

My view: the projects are a reputational buffer, not risk reduction. They sit elsewhere and do not change how the supplier's wood is audited. The EUDR tests supplier-level traceability for wood furniture from 30 December 2026 [5], so that is where an investor should look. The EU–Mercosur interim deal [6] is a second concern: more trade can shift deforestation elsewhere (my inference, not tested).

What would change my mind: independent evidence that IKEA's Brazilian wood is traced to the plot, and that its forest projects measurably reduce deforestation linked to its own supply.
