

CALVIN MINANG

PROJECT PORTFOLIO — GLOBAL MARKETS

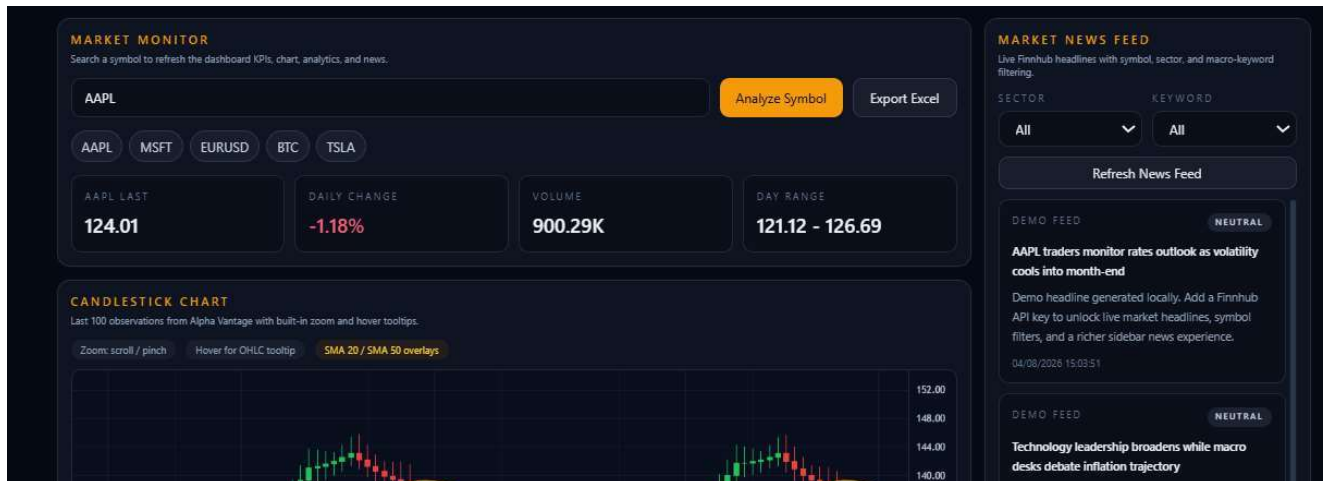

Three self-directed market projects: a cross-asset market terminal, a portfolio stress-testing engine and an option pricer with Greeks.

1 · CalvinX — Cross-Asset Market Terminal

JavaScript · Client-side · Public demo

Live market monitor: instrument search with KPI panel (last price, daily change, volume, day range), candlestick chart with SMA-20/SMA-50 overlays, and a sector/keyword-filtered news feed.

Built as a single-page app: data fetching, client-side indicators, regime detection (risk-on / risk-off) and Excel export. No framework — plain JavaScript, purpose-built to understand what a desk screen actually displays.

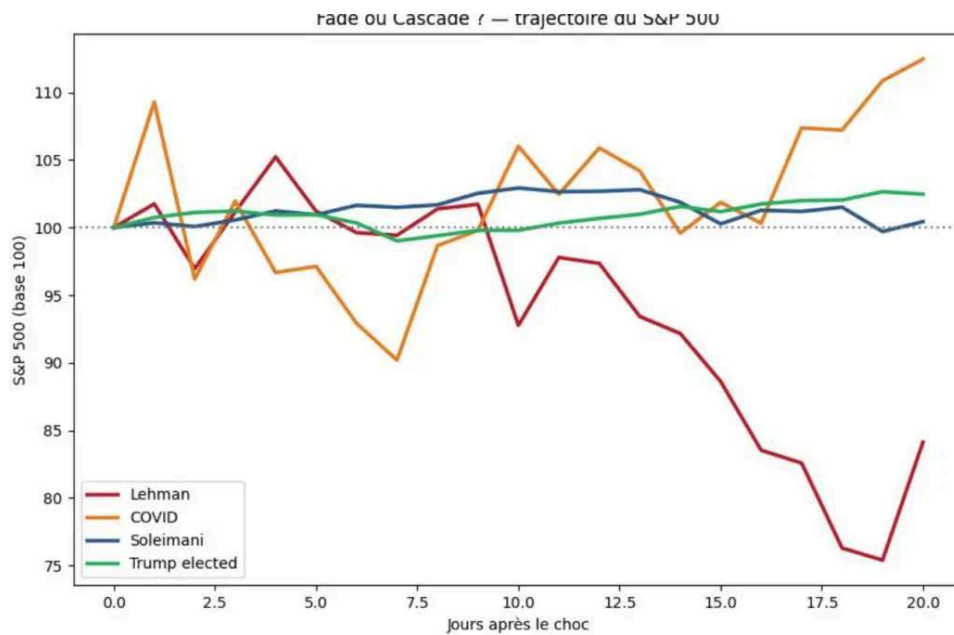

Demo: calvin-minibloomberg.netlify.app | github.com/Calvin29990/calvinx-market-terminal

2 · ShockLab — Portfolio Stress-Testing Engine

Python · SQL · Machine Learning

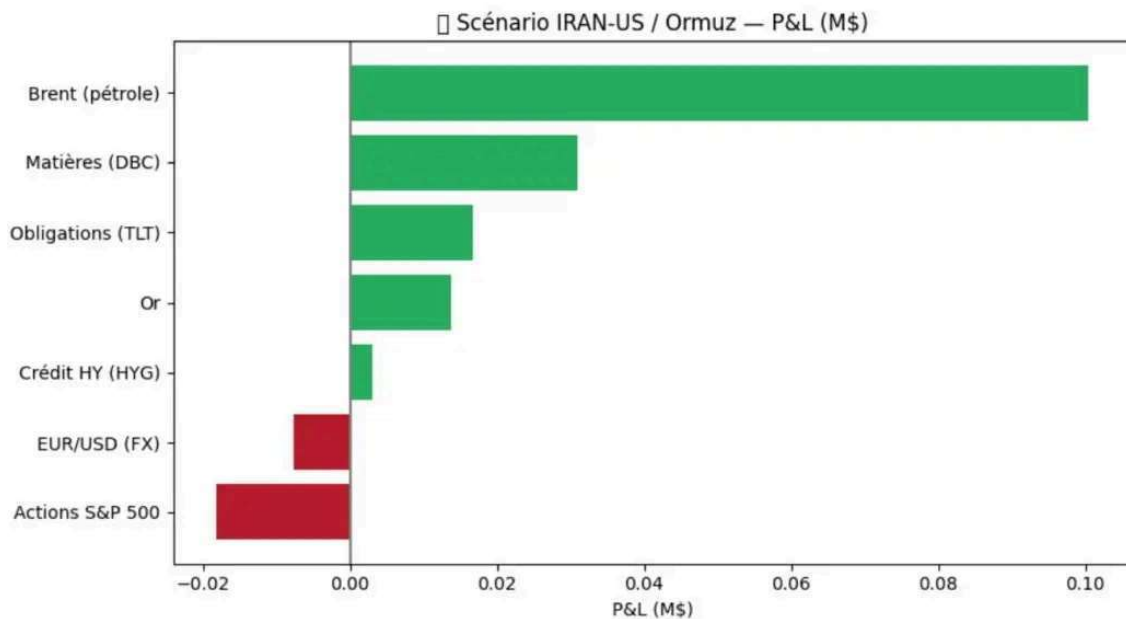

Scenario replay: historical analogues applied to a multi-asset book

The engine replays real market analogues — Lehman 2008, COVID 2020, the Soleimani strike, the 2016 US election — to quantify the P&L impact on a diversified portfolio over the 20 days following each shock.

S&P 500 trajectory (base 100) across four historical shocks — from fade to cascade.

Scenario output: Iran-US / Strait of Hormuz

Estimated P&L by asset class (USD m): long Brent and commodities, long Treasuries and gold, short S&P 500 and short EUR/USD — the classic geopolitical risk-off trade.

3 · Black-Scholes Option Pricer — Options & Greeks

Excel · VBA · Applied case study
